

Thinking about VBAC

If you have had a caesarean section (c-section) before, your midwife will talk to you about your options for this pregnancy. This handout aims to help you think and talk about your decision with your midwife, your partner and family and friends.

What are my options when giving birth after a previous caesarean section?

Most women will have the choice of planning either:

vaginal birth after caesarean section (VBAC)	repeat caesarean section (c-section)
VBAC is a safe choice for most women who have had a c-section. Many women who have had a c-section in the past will still be able to give birth vaginally. Some women who plan VBAC will end up having a c-section again.	Some women may prefer to have another c-section. For some women a planned c-section may be a safer option.

What are my chances of having a VBAC?

Most VBACs happen as planned.

It's hard to guess any woman's chance of having a VBAC. Some things about your own health history and previous birth experience(s) may make it more or less likely that you will give birth vaginally.

Your chances of having a VBAC are INCREASED if:

- You have had a vaginal birth before.
- The reason for your last c-section is not a factor this time (for example, your last c-section happened because your baby was in a feet-first (breech) position, and your baby's head is down this time).

Your chances of having a VBAC are DECREASED if:

- You are given drugs to induce (start) or augment (strengthen or speed up) your labour.
- Your BMI is over 25 – 30.
- You are 35 years of age or older.

You *may* have a higher or lower chance of having a VBAC if one or more of these factors apply to you. But there is no way to know for certain whether or not you will have a VBAC. Research shows that even if your chances of having a VBAC are decreased, you still have a greater than 50% chance of having a vaginal birth.

This document provides client-friendly information based on the Association of Ontario Midwives' Clinical Practice Guideline No. 14: Vaginal Birth after Previous Low-Segment Caesarean Section. It is designed to help you better understand some of the considerations and choices you may face while receiving care from your midwife. It is not intended to replace the informed choice discussions that you and your midwife will have. If you have any questions, concerns or ideas after reading over this document, please share them with your midwife.

What are some of the differences between VBAC and c-section?

Studies tell us that both VBAC and planned c-section are very safe. However, having a baby always involves some risk of complications, no matter what kind of birth you have.

Some risks of VBAC

Uterine rupture:

- Uterine rupture occurs when the wall of the uterus splits during pregnancy or labour. This usually happens along the scar of a previous c-section.
- Uterine rupture requires emergency surgery.

Uterine rupture happens in about 0.5% of ALL VBAC labours.

This means that one uterine rupture would be expected to occur for every 200 women who plan to have a VBAC.

Most mothers and babies will recover completely after uterine rupture. On rare occasions, uterine rupture can have serious effects:

- mother: excessive bleeding or removal of the uterus (hysterectomy)
- baby: brain damage or death

These sorts of results occur in fewer than 5% of cases of rupture. Because rupture occurs so rarely, the chances that a VBAC will lead to problems for the mother or baby are very low.

There is no way to know for certain who will have a uterine rupture. Your chances may be higher if:

- you had your last c-section less than two years ago, or
- you are given drugs to induce (start) or augment (strengthen or speed up) your labour this time.

Having one of these factors doesn't mean it is unsafe to plan a VBAC – it just means that the likelihood of having a uterine rupture is slightly higher, but still low.

Having an emergency c-section:

Some women who plan VBAC will need to have a c-section. This happens to about 1 in 4 women who plan VBAC. Having a c-section after labour has begun is associated with more risks (such as uterine infection) than a c-section before labour.

Some risks of repeat c-section

Problems related to surgery:

- Like any major surgery, repeat c-section can result in surgery-related problems: fever, infection, injuries to the bowel or bladder, or blood clots.

Neonatal breathing difficulties:

- Vaginal birth helps squeeze fluid from your baby's lungs. That's why babies born by c-section are more likely to have trouble breathing compared to babies who are born vaginally.
- Midwives and hospitals are well prepared to deal with babies' breathing problems. Most of the time these problems are mild and babies quickly recover.
- Breathing problems may require admission to a special nursery or newborn intensive care unit (NICU) for observation or treatment. This may mean that you are separated from your baby.

Problems with the placenta in future pregnancies

- Scars from c-sections can cause problems with how the placenta attaches itself to the uterus (placenta previa and placenta accreta). These problems can cause serious bleeding and, in rare occasions, can cause death.
- The risk of placenta problems increases with each additional c-section.

1 in 200 women will experience uterine rupture:

How can I decide what's best for me?

You may find it helpful to think about some of the common reasons women might choose each option. Like any aspect of childbirth, VBAC and repeat c-section each have risks. They also have their own benefits. Thinking about what benefits and risks matter most to YOU can help you decide whether to plan a VBAC or a repeat c-section.

You can add checkmarks to the table below to identify the reasons that matter most to you. Please feel free to add additional reasons that are important to you. Look to see where you have put the most checkmarks – you might want to give those reasons extra thought.

How much does this reason matter to you?

only a little

matters somewhat

matters a lot

Some reasons you might choose to plan a VBAC:	
You are more likely to have a shorter hospital stay and a faster recovery • This can mean you're able to return to your usual activities sooner.	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
You are less likely to have problems related to surgery	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
You are more likely to hold and breastfeed your baby sooner • This is partly because babies born by c-section are more likely to be admitted to a nursery or NICU for breathing difficulties.	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
You want to have more children after your current pregnancy • If you are planning to have more than two children, planning a VBAC is likely the safest option for you. The more c-sections you have, the more likely you will have placenta problems in the future. • You are more likely to have a positive birth experience • In one large Canadian study, women who had a VBAC rated their birth experiences more positively than women who had a repeat c-section	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
<i>Other reasons</i>	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>

Some reasons you might choose to plan a repeat c-section:	
You are less likely to experience uterine rupture	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
You avoid the risk of an emergency c-section • Some women who plan VBAC will still have a c-section. This happens to about 1 in 4 women. Having a c-section after labour has begun is associated with more risks (such as uterine infection) than a c-section before labour.	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
You can know when your baby will be born	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
You will know what to expect from surgery	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
<i>Other reasons</i>	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>

Who is helping you make this decision?

Are there other people in your life whose support or advice is important to you? Your partner? Family? Friends?

You may find it helpful to share this information with them as it may help them understand the options available to you, and get them thinking about what benefits and risks that THEY think are most important. This can also be helpful if you have already made a decision and you need them to understand why you have chosen one option over another.

Other resources

Two teams in British Columbia have published very useful resources for women who are thinking about VBAC: Optimal Birth BC:

<http://optimalbirthbc.ca/resources/for-bc-women-families/brochures-vbac/>

The Power to Push campaign, based at BC Women's Hospital:

<http://www.powertopush.ca/birth-options/types-of-birth/vaginal-birth-after-cesarean/>

There are also some American resources that women might find helpful:

Childbirth Connection: A not-for-profit organization in the United States that has worked to improve the quality of care for mothers, babies and families since 1918.

<http://www.childbirthconnection.org/article.asp?ClickedLink=293&ck=10212&area=27>

A Woman's Guide to VBAC: an online guide developed by Lamaze International to address issues and questions about VBAC.

<http://givingbirthwithconfidence.org/birth/a-womans-guide-to-vbac/>

Books:

The VBAC Companion: The Expectant Mother's Guide to Vaginal Birth After Cesarean

Author: Diana Korte

Harvard Common Press, 1997

Birthing Normally After a Cesarean or Two

Author: Helene Vadeboncoeur

Fresh Heart Publishing, 2011

Organization:

International Cesarean Awareness Network: <http://icancanada.ca/>

I still need more information to help me with my decision.

Your midwife can provide you with additional resources to help you with your decision. If you have specific questions please write them down below and bring this sheet to your next appointment.
